need is a browser.

For example, if you find yourself waiting for **pandas** code to finish running and want to go faster, you can switch to a GPU Runtime and use libraries like <u>RAPIDS cuDF</u> that provide zero-code-change acceleration.

To learn more about accelerating pandas on Colab, see the <u>10 minute guide</u> or <u>US stock market</u> <u>data analysis demo</u>.

Machine learning

With Colab you can import an image dataset, train an image classifier on it, and evaluate the model, all in just <u>a few lines of code</u>.

Colab is used extensively in the machine learning community with applications including:

- Getting started with TensorFlow
- Developing and training neural networks
- · Experimenting with TPUs
- Disseminating AI research
- Creating tutorials

To see sample Colab notebooks that demonstrate machine learning applications, see the machine learning examples below.

Working with Notebooks in Colab

- Overview of Colab
- Guide to Markdown
- Importing libraries and installing dependencies
- Saving and loading notebooks in GitHub
- · Interactive forms
- Interactive widgets

Working with Data

- Loading data: Drive, Sheets, and Google Cloud Storage
- Charts: visualizing data
- Getting started with BigQuery

Machine Learning Crash Course

These are a few of the notebooks from Google's online Machine Learning course. See the <u>full</u> course website for more.

- Intro to Pandas DataFrame
- Intro to RAPIDS cuDF to accelerate pandas
- <u>Linear regression with tf.keras using synthetic data</u>

Using Accelerated Hardware

- TensorFlow with GPUs
- TPUs in Colab

Featured examples

- <u>Retraining an Image Classifier</u>: Build a Keras model on top of a pre-trained image classifier to distinguish flowers.
- Text Classification: Classify IMDB movie reviews as either positive or negative.
- <u>Style Transfer</u>: Use deep learning to transfer style between images.
- <u>Multilingual Universal Sentence Encoder Q&A</u>: Use a machine learning model to answer questions from the SQuAD dataset.
- Video Interpolation: Predict what happened in a video between the first and the last frame.

```
import pandas as pd
import numpy as np

df=pd.read_csv('/content/Titanic (2).csv')
```

df.head()
